Field of the Invention The present invention relates generally to the art of electrical circuits and more specifically to an electrostatic discharge protection circuit in an integrated circuit. 2. Description of the Prior Art Electrical devices in the integrated circuit such as transistors and capacitors are usually made from a semiconductor material such as silicon, germanium or gallium arsenide. These electrical devices can be easily damaged by static electricity because the semiconductor material can easily trap electrical charges and electrostatic discharge. The electrostatic discharge can destroy a device or even a portion of the integrated circuit. One conventional way of preventing electrostatic discharge is to place an electronic fuse in series with the power source which is attached to a1d647c40b
