AutoCAD is used for 2D drafting in architectural, civil engineering, mechanical, and structural design. AutoCAD is currently the world's leading and most widely used 2D drafting software. It can be used by 2D drafters and 3D architects to lay out architectural, engineering, construction, and mechanical designs. These designs can be printed, exported to many formats, or imported into CAD software to produce 2D or 3D models. AutoCAD is owned by Autodesk (formerly Microstation Software Inc. and separate from the subsidiary Autodesk, Inc.), which was founded in 1982. In July 2008 Autodesk acquired the company that developed AutoCAD, Autodesk. The company was headquartered in San Rafael, California. The company was formerly named MicroStation Software Inc. before changing its name to Autodesk. MicroStation was a business unit of Autodesk. The current headquarters for Autodesk is in San Rafael, California. In 2015, the first model that used the Autodesk Author software was released on Autodesk's Autodesk Fusion 360 cloud-based tool. Fusion 360 makes it easy for anyone to turn a 3D model into a real-world product. It is the world's most used program for designing and drafting architectural, mechanical, engineering and construction models and 3D environments. Its most important use is to design and develop buildings, bridges, highways, and other man-made structures. There are currently 1.8 million architects, engineers and builders who use AutoCAD. AutoCAD has been around for over 25 years, since it first came out in the late 1980s. As of 2019, AutoCAD 2019 is the current version of AutoCAD. In addition, AutoCAD X is the current version of AutoCAD. AutoCAD X has been discontinued. AutoCAD 2004 is the previous version of AutoCAD. The oldest version of AutoCAD is AutoCAD 2.10. This is a DOS version of AutoCAD. AutoCAD LT AutoCAD LT, a computerized version of AutoCAD's original computer-aided drawing (CAD) software, is aimed at smaller businesses, home-based offices, and people without CAD expertise. AutoCAD LT is a "thin" version of the desktop application and was originally developed for the IBM PC. It is currently available on the Mac

Additional resources Category:Autodesk products Category:Technical communication toolsQ: Matching one character twice in an array I have two arrays, one of words and one of characters which can be used in the words. For example: Words = ["one", "two", "three"] Characters = ["o", "e", "n"] If the word contains a character then it is a valid word, if it doesn't, it is not valid. If the word is valid I want to return the word, but if it isn't valid then I want to return a random word of the same length. This is my code so far: words.each\_with\_index do |word, index| characters.each do |character| if words.include?(character) valid = true break else word2 = characters.sample valid = false end end end I know that this is incorrect, it is just a sketch of what I want. I'm fairly new to Ruby so any help would be greatly appreciated. A: # words.each\_with\_index do |word, index| characters.each\_with\_index do |character, index2| valid = characters.include?(word[index2]) break unless valid # do whatever you need to do end end If you have characters that can be used in words, you could just loop through all the words, and use your characters list to find if the word would be valid or not. # words.each do |word| characters.
