

Over a million AutoCAD licenses have been sold to end users since its debut, with the program used in many industries ranging from architecture and engineering to design, construction, mapping, drafting, and manufacturing. AutoCAD's capabilities and ease of use has made it the best-selling 3D CAD program in the world. History [edit] AutoCAD was originally developed as a personal graphics editor to allow for the mass distribution of architectural drawing files. The first release was on December 28, 1982. It was the first graphics-based application in the personal computing arena.[1] The first release as an AutoLISP application was in 1987. Initially, the first release of AutoCAD was for the Apple II and then for the IBM PC platform.[2] AutoCAD has since been ported to a wide variety of operating systems, including the Microsoft Windows platform, and various Unix variants. The latest release was on January 11, 2018. AutoCAD has been free for home users for the majority of its history. In 1988, after the success of the program, Autodesk launched the engineering program, SolidWorks. They were the first to release a commercial "Professional Edition" of their program for professional users in 1994, then they released a "pro" version that includes certain features available in the student version of the software. AutoCAD was initially available for only the Apple II and PC platforms. In 1990, the first Mac and Commodore 64 versions of AutoCAD appeared. In 1994, it was released as an early model of AutoCAD for Windows. At the time of release, AutoCAD was the only major CAD program available for Windows. Starting with AutoCAD 2003, Windows users were introduced to native Windows file formats for drawing files that were viewable in AutoCAD and other AutoCAD programs. AutoCAD 2013 and 2014 incorporated native Windows file formats for drawing files, and include a WYSIWYG (what you see is what you get) tool for generating document interfaces. In April 2012, Autodesk announced AutoCAD R14, which integrated rendering into the application, enabling 3D and section views to be available without the need for a separate rendering application.[3] AutoCAD is a multi-user product, meaning that multiple people can draw with the same program. Autodesk's description of AutoCAD states that the interface is designed for: people who work together to make large projects even larger and

Options AutoCAD comes with a number of options (some unique to AutoCAD LT and some available for AutoCAD), which give users more control over the software. Profiles Users are given the option to create multiple AutoCAD profiles for their computer system. Each profile contains an individual set of properties for opening, saving, and closing drawings. Profiles give the ability to have different opening, saving, and closing settings for all users of the computer and are an important way of controlling how documents are used. Printing, plotting, saving One of the most important choices a user makes when creating a new drawing or modifying an existing one is where and how they want to save the file. There are three important locations for saving documents: Clipboard The Clipboard is an object that holds all the information that the user has copied. It contains text, formatting, drawings, and comments in a single location. It is a great way to share files. Text information in the Clipboard can be exported from the Clipboard, saved, and then restored to the Clipboard. This functionality is great for sharing drawings as you can choose to save the information to the Clipboard instead of emailing it or using a cloud storage program. Text information in the Clipboard can also be used as a memory in a file which makes it useful for easy access to

specific information. Also, the export text functionality does not require Internet connection, making it a great alternative for the web version of AutoCAD. The Clipboard has the ability to "lock" the information within the Clipboard, preventing the information from being changed or modified. This "lock" functionality is great for people creating text in the Clipboard to make sure the information is stored exactly as they want it to be. Locking the information in the Clipboard is also helpful when creating drawings and exporting the information to PDF. If a user saves to the Clipboard and later deletes the information, the Clipboard will be "unlocked" and the information can be saved again. Although the Clipboard does not have the ability to be sent through email or directly uploaded to a web server, it does have the ability to be copied and pasted from one computer to another. The Clipboard can be locked by using the Options > Lock/Unlock Info > Select a tool or a sequence > Selection > Lock info on objects

The incidence of benign thyroid tumors and primary thyroid cancer has increased substantially in recent years. The National Cancer Institute-sponsored SEER (Surveillance, Epidemiology, and End Results) database was used to study treatment patterns and long-term outcomes in patients with primary thyroid cancer. The SEER database is a collection of population-based cancer incidence and survival data. We selected patients with non-medullary thyroid cancer (1998-2005) and benign thyroid tumors (1998-2004) who were treated with radioactive iodine (RAI). For this analysis, patients with thyroid cancer who had not undergone surgery or had metastatic disease at the time of RAI were excluded. We selected 4359 patients with benign thyroid tumors and 2730 patients with thyroid cancer. The median follow-up was 6.8 years (range, 0-10.4 years) for patients with benign thyroid tumors and 5.9 years (range, 0.1-10.4 years) for patients with thyroid cancer. Among patients with benign tumors, 16% were treated with a single dose, 26% with 2 doses, and 34% with more than 2 doses. Among patients with thyroid cancer, 31% were treated with a single dose, 35% with 2 doses, and 23% with more than 2 doses. Long-term outcomes were as follows: among patients with benign tumors, there were 15 deaths (0.4%) and 4 recurrences (0.2%); among patients with thyroid cancer, there were 32 deaths (1.0%), 9 recurrences (0.3%), and 4 lung metastases (0.1%). On multivariate analysis, dose [hazard ratio (HR), 2.4; P = 0.0001] and cancer status (HR, 1.8; P = 0.002) were significant predictors of death among patients with benign tumors. Dose (HR, 1.5; P = 0.03) and cancer status (HR, 1.3; P = 0.03) were significant predictors of death among patients with thyroid
