I have an abstract class, which I want to persist to a database. I am implementing this using a serializer and the flask-marshmallow package. I'm trying to use a db.GeneratedUUID() to generate a unique key. But I can't figure out how to do this. In a normal model, for a field like "name" I can just pass a default accessor. But I don't know how to implement a unique accessor. In the two code examples below, I expected model.name_id to be a unique key. class BaseModel(db.Model): id = db.Column(db.Integer, primary_key=True) name = db.Column(db.String(32)) name_id = db.Column(db.String(32), default=db.func.uuid_generate_v4) class Model(BaseModel): pass In [1]: a = Model() In [2]: a.

EquationPlot is a plotter for expressions, that is, math expressions, defined by You as a user. Rather than just provide a mathematical expression as input, it allows the expression to be defined as a user-defined expression. For example, instead of typing, " $2 + 3 - 4$ ", it is possible to type, " $(2 + 3) - 4$ ". This is very convenient for someone writing a math equation, because it is not at all clear what functions do what. You can also use the graphical user interface to create a user expression (further studies, please).

EquationPlot reads the expression you type and returns a plot defined by You on the screen. The resulting plot is not limited to just the area of the screen; you can set the plot to be transmitted to the printer or the plotter. Here is a simple plot that shows that EquationPlot is very easy to use. N equals 2; then N equals 3; then N equals -4; N minus 5; and finally, N to the 4th power. The equation was transformed using the "To Expression" command. In order for EquationPlot to work, You must install the .NET framework on the computer where the software application will be installed. Please see the Minimum Requirements section for a list of the installation requirements. The installation package installs into a folder and creates a shortcut file for easy start-up.

Simply move the shortcut file to the desktop and double click it to launch the EquationPlot software application. It doesn't modify Windows registry settings or create extra files on the disk without your permission. This is a very important feature of the program. The EquationPlot graphical user interface provides a simple workspace for performing your plotting jobs. Just type or paste a mathematical expression using the keyboard or you can use the built-in graphical editor to create your own expressions and plot them. For those who prefer to write their own expressions and understand the inner workings of EquationPlot, the software application does offer an advanced graphics editing mode. This advanced mode allows you to manipulate equations in a manner that is similar to Microsoft Excel, in terms of the graphic editing capabilities. You can either export the equations as an EquationPlot file or you can print out the image created by EquationPlot on paper. An example of a printed plot is shown below: EquationPlot is a full-featured plotting tool. The following are some of the many features of this powerful software application: • Equation 09e8f5149f
