Q: Simple but useful rbx files I am working on a project where I need to use a number of rbx files. These are quite simple in that they just require a set of attributes and a path to the source file. Some examples are: attributes: basePath = 'C:/mysource/myproject' accessPath = 'C:/mysource/myproject/path/to/foo' And the path to the source file is: path = 'C:/mysource/myproject/path/to/foo' How can I export these from a vim script so that I don't have to manually export each time? I would ideally have a .rbx file which has these basic attributes and another file for the path, e.g. a myproject.rbx and a myproject.rbx.

A: You don't need rbx files. They are nothing more than a convenient way of keeping a number of related variables. For example, you could put all of your .rbx files under a directory called configuration, and then write: variable 'basedir' #../configuration/basedir variable 'path' #../configuration/path in your vimrc, and then just use the variables with ruby's get_variable(name) function. You can even make it so that certain variables are only available in certain contexts, so you only need one set of .rbx files.

A: I am not familiar with that particular script, but as a general point of interest, you might look into the YAML format, which is particularly well suited to serializing data in a non-procedural manner.

A: Vim's own scripting language, vimscript, provides standard facilities for serializing data and storing it in files. Specifically, the 'persistent' feature provides the persistent.vim script that allows one to create persistent variables: function! GetKeyword(str) let l
