## **What's New In Nightrider-slow?**

The idea of Nightrider-slow started in the year 2000 with the project of a slow-motor controlling a quadcopter. The main idea was that the PIC16C84 could work like a slow motor. It would take longer to do anything and an LED would be activated. This project was successful and had its first article published in Germany. It had some nice pictures that helped understanding the system. After some years, the project evolved to a more complex model that can be used to control various electronic equipment. The main idea is still the same, the PIC 16C84 works like a slow motor, and an LED is activated. Features: The model has a PIC 16C84 MCU, a capacitor, a relay, a potentiometer and a LED. On the input side, the PIC is connected to the computer with the parallel port (PLK) and to the capacitor with a switch. When the switch is closed, the PIC is powered. The capacitor is connected in parallel with the input voltage. When the PIC does not work, the switch is open, the capacitor is discharged. This feature allows to understand the functioning of the PIC. On the output side, a relay is connected to the pin 7. This means that when the PIC is connected to the computer via the parallel port, it has an output, when not, the relay is activated. The potentiometer is connected to pin 12. When the pin is high, the output of the PIC will be also high. But when the pin is low, the output of the PIC will be low. The LED is connected to pin 3. When the PIC is in a normal working mode, it is high. But when the PIC is working

with the relay, it is low. The idea is to learn how to program the PIC 16C84. You can see the circuit as a simulation of the microcontroller. By varying the circuit with the potentiometer and the switch, you can program the PIC. How to run: As the model is programmed with Java, you must have a Java interpreter installed in your computer. The program can also be run on any computer that has a Java interpreter. You can also start the program directly on your computer with your browser. However, if you want to work on the model and test it, you need to work with the computer that you have the program running on. You can connect to it with a serial port. To run the model, you need the PIC16C84 from ICD-C (D) version of PIC16C84. These microcontrollers have an ICD (D) model, instead of the ICD model found on the regular PIC16C84. If you
