AutoCAD has a history of multiple competing versions. This article is about the latest version, AutoCAD 2017, and related parts of AutoLISP. The term AutoLISP is used to describe the software application itself, and its related parts (like the language interpreter and run-time) together. AutoCAD 2017 is an autocad-branded version of AutoLISP for use with AutoLISP for AutoCAD. AutoCAD has been a commercial product since the introduction of the software in 1982. When it was first released,

AutoCAD could only run on machines with 32-bit x86 CPU architecture or a compatible CPU architecture. Since the introduction of the AutoCAD App for iPad in November 2012, it can also run on Apple iOS mobile devices. AutoCAD 2017 has not been significantly updated since its release in the summer of 2016. AutoCAD 2017 is a current, feature-rich application with numerous new capabilities and uses. Some of the new features include object interaction, object physics, user interface features, custom features, custom user interface features, on-screen keyboard, and more. AutoCAD is designed for architects, engineers, and drafters to design and draft. It is also used by salespeople and anyone who needs a drawing or design. AutoCAD supports 2D drafting, 2D and 3D design and construction, 2D and 3D modeling, 2D and 3D drawing, 2D and 3D rendering, 2D and 3D printing, 2D and 3D CNC (Computer Numerical Control) milling, 2D and 3D file sharing and collaboration, and more.

Field of the Invention

This invention relates generally to fiber optic cables and, more particularly, to fiber optic cables that transmit telecommunications signals between locations in buildings. 2. Description of the Related Art Fiber optic telecommunications technology is emerging as the technology of choice for the telecommunications industry. Fiber optic cable is becoming increasingly popular with telecommunications providers because it is very flexible, reliable and offers a high bandwidth

transmission capacity compared to copper-based cables. This increased reliability and bandwidth capacity are particularly important for transmitting data communications. Moreover, the inherent bandwidth capacity of optical fiber is much greater than coaxial cable. As a result, optical fiber is becoming a prevailing choice for new telecommunications networks. Fiber optic cables can be constructed in a variety of diameters and lengths, depending on the application. The standard fiber optic cable, which is widely used in telecommunications systems, includes eight or nine individual optical fibers. The fibers, which are bound together, are usually surrounded by a buffer tube that also functions as a protective coating for the fibers. The buffer tube usually consists of aramid yarn and/or synthetic polyester yarn impregnated with an acrylate based polymer. The buffer tube generally has a diameter of about one-quarter inch and a length of about four feet. A connector is attached to one end of the buffer tube, and an end-user plug is attached to the other end. The end-user plug includes one or more ports for receiving a fiber optic cable. The other end of the fiber optic cable can be attached to another connector that is located at the end-user's equipment, such as an optical transceiver. Thus, the fiber optic cable is used to transmit optical signals between the end-user's equipment. The light carrying fibers in a fiber optic cable can bend for a variety of reasons, e.g., physical obstacles, atmospheric forces and the like. It a1d647c40b
