What's New in the AutoCAD?

Use our Markup Import and Markup Assist to import real-world images from paper, screen or even your webcam and incorporate them directly into the AutoCAD drawing without the need for additional steps. (video: 0:55 min.) 3D models and drawings can now be sent to the client during Revit design review with an Export to DWG option. Network Path Detection: You can now use the new Network Path Detection feature in AutoCAD 2023. Network Path Detection helps you determine whether the drawing should be shared through the network and how to correctly configure network settings to prevent slow network performance or disconnections. The setting is similar to that of the Draw Path setting. However, it allows you to only include the paths used when sharing a drawing. Help You Don't Need to Know: The new Help You Don't Need to Know feature allows you to customize AutoCAD help to display only the content relevant to your work and avoid unnecessary cluttering. Layers and Mapping: You can now create and manage multiple layers, or layersets, within a drawing. It is now possible to automatically map layers that are linked to a drawing's members, giving you an easy way to show the context of various layers with the use of the AutoMap visual style. You can easily manage the members that are linked to the layers and easily navigate between the layers in a drawing. Layers provide the basis for the Zoom Layer and Pan Layer features in AutoCAD and AutoCAD LT. Snap Offsets: Snap Offsets allow you to attach an offset to the endpoint of a line or polyline that can be used to attach a point, such as a node or dimension, to a line or polyline. (Video: 1:15 min.) Snap Line Offsets allow you to set a specific offset for a line that can be used to attach a line. This can be useful when you want to easily attach a line to a vertex of a face, such as when you are connecting the face with a face or axis. Point Placement: Point Placement allows you to place points on the 3D model and link them to existing lines or surfaces. Point Placement can be used to attach points on the surface of a 3D model to the nearest vertex or surface, and to the lines or polylines that intersect with the surface.
