Time-resolved metabolic profiling of glutathione, adenosine triphosphate, and ribonucleotides in pathophysiology and pharmacology. The study of molecular processes and networks within cells by metabolomics has become a major focus of systems biology. We present a "time-resolved metabolomic" protocol for the study of glutathione (GSH), adenosine triphosphate (ATP), and ribonucleotide species (GDP, GMP, ATP, ADP, GDP, and GTP) in cell and tissue extracts. This novel procedure is based on the use of isotopically labeled standards to achieve an absolute quantification of metabolites, using data-independent acquisition mass spectrometry on a Q-Exactive. The protocol is exemplified in the study of ATP production and consumption, and its potential role in the neurodegenerative diseases associated with Alzheimer's and Parkinson's diseases. A prospective study of an experimental model of ischemic stroke in rats is presented, indicating the potential role of ATP-consuming catabolic pathways in response to the ischemic insult. These studies show that the time-resolved metabolomics approach can provide insight into pathophysiology and pharmacology. {.332} {.333}  \* Sound Card: DirectX 10 Sound Device \* Graphics Card: DirectX 10 compatible GPU with 2 GB of video memory (NVIDIA, ATI, or Intel) \* Keyboard: Xbox 360 Controller
