A sphere rotating about its axis has been used to actuate a suspended drop of fluid. An annular stream of oil is ejected in a coaxial manner; two possible types of flow may occur depending upon the nature of the drops produced in the flow: shear-free, at constant angular velocity and a shear-cellular, where there is a cell of oil at a fixed radius about the rotation axis. Discrete-element method (DEM) simulations show that the flow may be correctly reproduced by employing a rotation speed of 496 ± 7 degrees/s and a drop volume of 1.08 ± 0.07 microliter. The experimental findings are compared with the results obtained from model calculations and the dipole-quadrupole potential. The model describing the drop production as a series of small bubbles is found to fit well the experimental results and displays excellent agreement with the observations. This invention relates to the field of high density, high purity, catalytically active metal particles and particles containing multiple types of catalytically active metals. Single-metal and multimetal catalysts have many useful applications, including in the field of fuel cells, and more specifically in electrochemical methanol synthesis. In general, in an electrochemical methanol synthesis process, an aqueous methanol solution is contacted with an electrode catalyst in an electrochemical cell containing one or more reactive anode and cathode materials. The electrochemical cell produces electrical current from which the energy required for the chemical conversion is derived. These electrochemical processes are particularly useful as a means for producing chemicals, such as ethanol, having different ratios of hydrogen to carbon in their chemical composition, and are known as the "hydrogenation" processes. Due to the strong reactivity of the reactant materials, which are typically aqueous solutions, they typically require a catalyst to safely produce hydrogen, methanol, and/or other desired reaction products from a reactant compound. Thus, the safety of the overall hydrogenation processes depends on the safety of the catalytic metal, and the ability to recover the catalytic metal following use is important. Several different types of electrochemical process arrangements are known 6d1f23a050
