
Neufert Bauentwurfslehre Deutsch

Download

from 1933, neuferts architectural career was intertwined with the resistance and liberation. first, as a member of the communist party of germany (kpd), he opposed the national socialists on ideological grounds. second, as a member of the socialist party of germany, he was the architect of the social democrats' (spd) postwar strategy of joining the federal republic of germany (frg). from the mid-1930s, neuferts work became more and more specialized in the technical aspects of glass manufacture, and he was responsible for the design of such structures as the glass department in the bayerische werkstille, the bayerische glas- und keramikfabrik and the chemisch-zentraler werkstelle für das bayerische glaswerk. by the mid-1940s, he was working on glassmaking research at the kaiser wilhelm institute for glass research in berlin. after the war, neuferts architectural career took a different direction. in the early 1950s, he designed the glass factory for the bayerischer werkstelle für schnittbildern in freising. in 1952, he was appointed director of the bayerische glas- und keramikfabrik in

biberach. in 1954, he became head of the chemisch-zentraler werkstelle für das bayerische glaswerk. neuferts involvement with the mechanical engineering and production activities of glassmaking would be the main focus of his professional work during his career.

his first work in this area was the bayerisches schokoladenwerk in 1950 in biberach. neuferts work on the factory enabled him to study the production of glass in germany and the necessary changes in the glass factories to make the transition to economy of scale viable. at the same time, he was aware of the importance of a smooth transition from the old production process to the new. he was in contact with the verband deutscher keramikindustriellen (vdk) and became a member of the committee to draft the laws that would change the nature of the glass industry in west germany.

Neufert Bauentwurfslehre Deutsch

ernst neufert designed the system of connection between buildings known as the bauhausgefängnis. using an unbuilt system, he produced the berlin passenger train station which was commissioned in 1937. the neufert foundation is a non-profit organization, and the bauhaus dessau settlement foundation was founded in 1972. the foundation is supported by the city of dessau, the german federal government, and the province of saxony. neuferts involvement in the standardization of architectural dimensions and building practices, for which he is best known, started in 1926, when he began teaching at the staatliche bauhochschule in weimar. here, a compulsory module for new students was schnellentwerfen (fast design), which allowed a very limited time to develop architectural solutions to a given brief. the academic catalog from 1929 described the class: schnellentwerfen (fast design), which allowed a very limited time to develop architectural solutions to a given brief. the academic catalog from 1929 described the class: neufert published his recommendations on octametric bricks in 1941, a date that suggests sinister motives behind the obsessive drive for standardization. not only did hitler and speer need to rebuild german cities quickly to keep up morale, but a standardized building system was also essential because forced laborers, prisoners, and volunteers had no prior experience in

building, and the first two groups were suspected of sabotage and perhaps 30 to 40 percent less productive due to malnutrition, disease, and torture. furthermore, with prison and slave labor hailing from all lands occupied by the reich, a standardized building system would eliminate much miscommunication. [16] neufert hoped that a standard grid of 12.5 centimeters could be set for all architects and builders, in effect standardizing design itself. from 1941 the ss adopted neuferts octametric system in poland and some of its furniture-production facilities. [17] neufert wrote, if a building is planned according to the octametric system, the contractor only needs an octametric levelling rod in order to organize the entire building, the axial distances, windows, doors, posts, and partitions, on a rapid and mistake-free basis.
