There are no problems, either. There is no lag when you open layers, for example. And those same layers act as generators for brushes and paper textures, among other things. I have not found anything that would prevent the iPad Pro from holding up as an onscreen canvas for creating. Sketch is certainly the best example of the "real Photoshop for the Apple Pencil" combination, since there is no lag involved in every action. You can see, hear, and feel how things are moving virtually. Sketch is also the perfect example of where Lightroom can gain a lot of momentum. Imagine if Sketch had excellent multi-layer support, and being able to work with paper textures easily. It also helps that Sketch offers post-production opportunities. It is possible, for example, to use the Wacom Bamboo Paper app to scan in a drawing and then add you Layer and edit details, perhaps to create a surreal drawing on glass. In essence, you are creating a new image in a Node description using the drawing on Bamboo Paper as the basis. As far as I know, this doesn't work in Photoshop yet, but it is a good example of how next-generation features can be used right now, even if potential ways to use them are still being determined.
